## COMBINING NARROWBAND APPLICATIONS WITH BROADBAND TRANSPORT

## ABSTRACT

combination of narrowband applications The broadband transport may be enabled with a tri-level nodal system in which a narrowband node (e.g., a telecommunications node) may provide switching intelligence to the switching fabric of multiple broadband nodes (e.g., media gateways). The switching intelligence is provided via an intermediate node (e.g., media logic) that emulates a switch interface for node and translates circuit-based narrowband the addresses/routing instructions to packet-based addresses/routing instructions. This translation equates to a mapping of address(es) in a first address space to address(es) in a second address space in order to utilize the address(es) of the second address space for propagating communications on a broadband transport mechanism.
